

EXPERIMENT-11 16-BIT MULTIPLICATION

AIM: To write an assembly language program to implement 16-bit multiplication on 8086 processor.

ALGORITHM:

1. Load the first data in HL pair.
2. Move content of HL pair to stack pointer.
3. Load the second data in the HL pair and move it to DE.
4. Make H register as D and L register as H.
5. Add HL pair and stack pointer.
6. Check for carry of carry increment by 1 else move to next step.
7. Then move E to A and perform OR operation with accumulation and register D.
8. The value of operation is zero then solve the value else go to step 3.

PROGRAM:

```
MOV AX, [1100H] - load first number
MOV BX, [1102H] - load second number
MUL BX - multiply AX by BX.
MOV [1200H], AX - store higher result.
MOV [1202H], DX - store higher result.
HLT - halt program execution.
```

Input:

Output:

Address	Data	Address	Data
1100	20	1200	60
1202	3	1202	81

Result: Thus, the program was executed successfully using 8086 simulator.

MOV [1202H], DX
HLT
